

Data Appendix: Imputed Data

Remizova Alisa

This is a description of the individual-level data used in the analysis. The dataset is the data of the joint dataset of the World Values Survey (WVS) round seven and European Values Survey (EVS) round 5 2017-2022 combined with the dataset of the WVS round six 2010-2014. These three datasets underwent preparatory analysis, such as recoding indicators and excluding countries with omitted religiosity indicators (for details, see the document “DataAppendix” and Table 1 in the Appendix) before being combined. The current document presents the descriptive statistics for six religiosity indicators used in the main analysis those missing values were imputed with the *mice* R package. For the share of missing values for each indicator (by country) before imputation, see Table 3 in the Appendix.

There are five separate imputed datasets, so the document is divided into sections corresponding to indicators, and each of them has specific statistics for each dataset. The descriptive statistics are presented by country (N = 84).

Importance of religion

Coding: 1 = Not at all important; 2 = Not very important; 3 = Rather important; 4 = Very important
